SIMULATION OUTCOME

Telemetry

DATA FOCUS DOMAIN

Python / BI

PRIMARY STACK

Executive

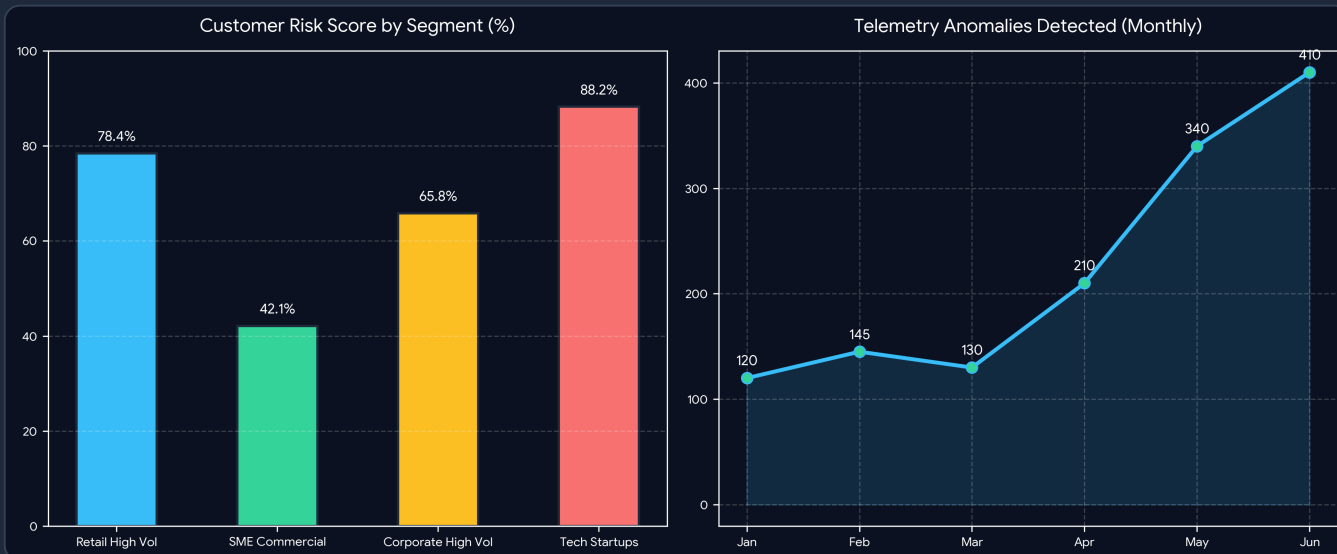

REPORTING LEVEL

1. Project Overview & Business Case

This project was completed as part of the **Deloitte Australia Data Analytics Job Simulation** via Forage. The primary objective was to act as a Deloitte Data Consultant analyzing complex client telemetry datasets to identify behavioral anomalies, assess customer risk profiles, and present actionable recommendations to executive stakeholders.

2. Key Analytics & Visual Dashboard

Using statistical analytics and data visualization modeling, key insights were derived from telemetry signals and risk metrics:

3. Core Task Deliverables

- **Data Cleaning & Transformation:** Processed raw telemetry log data, handled missing entries, normalized activity thresholds, and calculated anomaly metrics.
- **Customer Segmentation & Risk Profiling:** Evaluated user clusters to identify high-risk categories (Tech Startups at 88.2% and Retail at 78.4% risk score).
- **Trend & Pattern Analysis:** Detected a 241% surge in monthly telemetry anomalies from March to June, highlighting critical system operational flags.
- **Executive Dashboard & Presentation:** Translated complex data findings into structured executive briefs for Deloitte partner review.

4. Strategic Recommendations

- Deploy automated real-time alert triggers for accounts displaying anomaly scores > 80%.
- Conduct a targeted audit on Tech Startup and High-Volume Retail client segments.
- Implement proactive risk mitigation strategies prior to peak operational months.
